Organization

Raritone

DOCUMENT OVERVIEW

This technical documentation provides a comprehensive, structured, and in-depth explanation of the analytics framework designed, studied, and implemented during the Raritone Data Analyst Internship. It presents a systematic overview of how data generated from user interactions within a fashion e-commerce platform can be effectively captured, processed, analyzed, and transformed into meaningful business intelligence.

The document explains in detail how various forms of user behavior data—such as product views, search patterns, wishlist activity, cart interactions, checkout attempts, and virtual try-on engagement—can be utilized to understand customer intent, preferences, and decision-making patterns. It also covers how engagement metrics, retention indicators, and conversion funnel stages collectively help in evaluating platform performance and identifying areas of improvement across the customer journey.

In addition, the documentation elaborates on retention patterns that highlight user loyalty and churn behavior, as well as conversion funnel analytics that identify drop-off points at different stages of the shopping experience. Special emphasis is given to virtual try-on analytics, which plays a key role in improving customer confidence, reducing purchase uncertainty, and enhancing product interaction in a digital fashion environment.

Furthermore, the document describes the KPI (Key Performance Indicator) framework in a structured manner, explaining how different categories of metrics—including acquisition, engagement, retention, and conversion KPIs—are defined, calculated, and used for business evaluation. It also includes detailed insights into dashboard structures that visually represent key business metrics for faster interpretation and decision-making.

The segmentation models discussed in this documentation help classify users into meaningful behavioral groups such as new users, active users, frequent shoppers, inactive users, and virtual try-on users. These segments enable more targeted analysis and personalized strategy development.

Additionally, the document includes competitor benchmarking analysis, where major fashion e-commerce platforms are studied to understand industry best practices in personalization, recommendation systems, customer engagement strategies, and user experience optimization. It also explores AI recommendation system concepts that demonstrate how machine learning and behavioral data can be used to generate personalized product suggestions and improve discovery.

The business intelligence reporting system described in this documentation consolidates all analytical outputs into structured reports that support strategic decision-making. These reports help stakeholders understand performance trends, customer behavior, and growth opportunities.

The primary objective of this documentation is to demonstrate how raw and unstructured user activity data can be systematically transformed into structured, actionable, and data-driven business insights. These insights play a crucial role in supporting strategic decision-making, enhancing customer experience, improving engagement and retention, optimizing conversion rates, and ultimately strengthening the overall performance and scalability of the fashion e-commerce platform.

PROJECT DESCRIPTION

The project focuses on deeply understanding customer behavior within a fashion e-commerce environment and applying structured analytics techniques to improve overall business performance and decision-making. It is built on the fundamental principle that every user interaction within a digital platform generates valuable behavioral data that can be captured, analyzed, and transformed into actionable insights.

These interactions include activities such as product browsing, search behavior, wishlist additions, cart engagement, checkout attempts, and virtual try-on usage. By analyzing these behavioral patterns, the system aims to understand how users navigate the platform, what influences their purchase decisions, and what factors impact their engagement levels.

The analytical framework is designed to improve key business areas, including:

• Customer engagement by identifying features and content that attract and retain user attention
• Product discovery by optimizing how users find and explore relevant fashion items
• Purchase conversion by analyzing and reducing drop-offs across the shopping funnel
• User retention by studying long-term user behavior and improving repeat usage
• Personalization by tailoring recommendations based on individual preferences and behavior history

• Virtual try-on adoption by evaluating how immersive experiences influence confidence and purchase intent

The project also emphasizes the importance of data-driven decision-making in modern fashion e-commerce platforms, where customer expectations are increasingly shaped by personalization, speed, and interactive shopping experiences.

In addition to theoretical research, the project incorporates practical dashboard development using simulated datasets that mimic real-world e-commerce environments. These dashboards help visualize key performance indicators, track user behavior trends, analyze conversion funnels, and evaluate engagement metrics. This combination of research and practical implementation provides a holistic understanding of how analytics can be effectively applied to solve real business challenges in the fashion industry.

BUSINESS PROBLEM STATEMENT

Modern fashion e-commerce platforms operate in an increasingly competitive digital environment where customer expectations are continuously evolving. Despite rapid technological advancements, many platforms still face significant challenges in delivering a seamless, engaging, and personalized shopping experience. These challenges directly impact customer satisfaction, conversion rates, and long-term business growth.

One of the major issues is **low customer retention rates**, where users often visit the platform once or twice but do not return consistently. This indicates a lack of sustained engagement and insufficient strategies to build long-term user loyalty. Retention is a critical factor in e-commerce success, as retaining existing customers is significantly more cost-effective than acquiring new ones.

Another major challenge is **high cart abandonment rates**, where users add products to their cart but do not complete the purchase. This behavior is often caused by factors such as unexpected pricing, complicated checkout processes, lack of trust, or hesitation due to uncertainty about product fit and appearance.

A further limitation is the **lack of personalization** in product recommendations and user experiences. Many platforms still rely on generic recommendation systems that do not fully consider individual user preferences, behavior history, or style choices. As a result, users are often shown irrelevant products, reducing engagement and purchase likelihood.

Additionally, **difficulty in product discovery** remains a major concern. Users often struggle to find relevant products due to inefficient search systems, poor filtering options, or lack of intelligent recommendation mechanisms. This leads to reduced browsing satisfaction and lower conversion rates.

Another critical issue is **poor size and fit confidence**, which is particularly important in fashion e-commerce. Customers are often uncertain about how clothing items will fit them, leading to hesitation in purchasing and increased return rates. This problem significantly affects customer trust and overall platform reliability.

Finally, **limited customer engagement** is a widespread challenge, where users interact minimally with the platform beyond basic browsing. Without engaging features such as interactive tools, personalized content, or immersive experiences, platforms struggle to maintain user attention.

To address these challenges, Raritone aims to build a data-driven and intelligent fashion e-commerce ecosystem that leverages modern technologies and analytical systems. The proposed solutions include:

• Data-driven analytics to understand customer behavior and improve decision-making
• AI-based recommendation systems to provide personalized product suggestions
• Virtual try-on technology to enhance product visualization and reduce purchase uncertainty
• Customer intelligence systems to analyze user patterns and preferences
• Behavior-based segmentation to group users and deliver targeted experiences

Through these approaches, Raritone aims to transform traditional fashion e-commerce into a more intelligent, personalized, and user-centric platform that enhances engagement, improves conversion rates, and builds long-term customer loyalty.

SYSTEM ARCHITECTURE

The analytics system is designed following a structured and systematic data pipeline that transforms raw user activity into meaningful business intelligence. This pipeline ensures that every stage of data handling—from user interaction to final decision-making—is organized, traceable, and optimized for generating actionable insights.

The process begins with User Interaction, where users actively engage with the fashion e-commerce platform through various actions such as browsing products, searching items, adding products to wishlist, adding items to cart, initiating checkout, and using virtual try-on features. Each of these interactions generates valuable behavioral data that reflects user intent and preferences.

This raw data is then passed into the Data Collection stage, where all user activities are systematically recorded and stored in structured formats. This may include event logs, session data, transaction records, and feature usage statistics. The purpose of this stage is to ensure that no important user interaction is lost and that all relevant data is captured for analysis.

In the Data Cleaning and Processing stage, the collected data is refined to improve accuracy and consistency. This includes removing duplicate entries, handling missing values, correcting inconsistencies, and organizing the data into a usable format. Data preprocessing ensures that the analytical results are reliable and free from errors or noise.

Once the data is prepared, the system moves to KPI Calculation, where key performance indicators are computed based on business requirements. These KPIs include metrics such as user engagement rate, retention rate, conversion rate, add-to-cart rate, session duration, and virtual try-on usage. This stage translates raw data into measurable business performance indicators.

The next stage is the Visualization Layer, where calculated KPIs and analytics results are presented using dashboards and visual reports. Graphs, charts, funnel diagrams, and KPI cards are used to simplify complex data and make it easier for stakeholders to understand trends and patterns.

Following visualization, the system performs Insight Generation, where patterns, trends, and anomalies are analyzed to derive meaningful conclusions. This stage helps identify user behavior patterns, drop-off points in conversion funnels, engagement trends, and opportunities for business improvement.

Finally, the process concludes with Business Decision Making, where insights generated from the analysis are used to guide strategic decisions. These decisions may include improving recommendation systems, optimizing user experience, enhancing marketing strategies, and increasing customer retention efforts.

Overall, this pipeline ensures that raw behavioral data is systematically transformed into structured, meaningful, and actionable business intelligence reports that support data-driven decision-making and continuous platform improvement.

DATA SOURCES AND DATA MODEL

Since real production data was not available, the system uses structured sample datasets based on industry benchmarks. These datasets were carefully designed to simulate real-world fashion e-commerce user behavior and ensure meaningful analysis for KPI calculation, dashboards, and business insights.

User Activity Data includes all interactions performed by users on the platform. This consists of app opens, product views, product clicks, wishlist additions, add-to-cart events, checkout attempts, purchases, and virtual try-on interactions. Each of these actions represents a step in the customer journey, starting from discovery and ending in purchase. By analyzing this data, the system helps in understanding how users navigate through the platform, which products attract attention, and where users drop off during their shopping experience.

Engagement Data focuses on how actively users interact with the platform over time. It includes Daily Active Users (DAU), Monthly Active Users (MAU), session duration, number of screens viewed, and feature-level interactions such as wishlist usage and try-on activity. This dataset is essential for measuring platform stickiness, user interest, and overall engagement quality. Higher engagement typically indicates better user experience and stronger platform relevance.

Conversion Data tracks the progression of users toward making a purchase. It includes product views, cart additions, checkout initiations, and final purchases. This dataset is crucial for conversion funnel analysis, as it helps identify where users are most likely to drop off. It also helps in understanding which stages of the buying journey need improvement to increase sales and reduce abandonment rates.

Retention Data focuses on long-term user behavior and return activity. It includes returning users, churned users, retention percentages, and cohort-based behavior analysis. This data is important for evaluating how well the platform retains users over time and how effectively it encourages repeat usage.

KPI FRAMEWORK

KPIs are the foundation of analytics systems and are divided into four major categories.

1. USER ACQUISITION KPIs

Total Users

Represents the total number of registered users on the platform.

Formula:
Total Users = Existing Users + New Users

Business Use:
Measures overall platform growth and reach.

New Users

Represents newly acquired users during a specific time period.

Business Use:
Helps evaluate marketing campaign effectiveness.

Customer Acquisition Cost (CAC)

Measures how much it costs to acquire one customer.

Formula:
CAC = Total Marketing Spend / Number of New Customers

Business Use:
Helps optimize marketing budget efficiency.

2. USER ENGAGEMENT KPIs

Daily Active Users (DAU)

Number of unique users interacting daily.

Business Use:
Measures daily platform engagement.

Monthly Active Users (MAU)

Number of unique users interacting monthly.

Business Use:
Shows long-term engagement trends.

Session Duration

Average time users spend per session.

Formula:
Session Duration = Total Time Spent / Number of Sessions

Business Use:
Measures engagement quality.

Product Views

Total number of product pages viewed.

Business Use:
Indicates user interest in products.

Virtual Try-On Usage Rate

Formula:
Try-On Usage Rate = (Try-On Users / Total Users) × 100

Business Use:
Measures adoption of AR/virtual try-on feature.

3. RETENTION KPIs

Day 1 Retention

Percentage of users returning the next day.

Formula:
(Returning Users Day 1 / New Users) × 100

Business Use:
Measures initial user satisfaction.

Week 1 Retention

Percentage of users returning after 7 days.

Business Use:
Measures short-term engagement quality.

Monthly Retention

Percentage of users returning after 30 days.

Business Use:
Measures long-term loyalty.

4. CONVERSION KPIs

Add-to-Cart Rate is a key conversion metric used to measure how effectively products attract user interest. It is calculated using the formula (Add-to-Cart events / Product Views) × 100. This metric helps in understanding whether users find products appealing enough to save them for purchase consideration. A higher add-to-cart rate indicates strong product relevance, attractive visuals, good pricing, or effective recommendations, while a lower rate may indicate poor product presentation or mismatch with user expectations. From a business perspective, it is widely used to evaluate product performance, optimize catalog design, and improve recommendation systems to increase engagement at the consideration stage.

Checkout Rate measures the percentage of users who proceed from cart addition to the checkout process. It is calculated as (Checkouts / Cart Additions) × 100. This metric represents purchase intent and helps identify how many users are seriously considering completing a transaction after adding items to their cart. A high checkout rate indicates smooth user experience, trust in the platform, and effective pricing strategy, whereas a low checkout rate may suggest issues such as unexpected costs, complicated checkout flow, or lack of payment flexibility. Businesses use this metric to optimize the checkout process and reduce friction in the buying journey.

Conversion Rate is one of the most important business performance indicators in e-commerce. It is calculated as (Purchases / Visitors) × 100. This metric measures the overall effectiveness of the platform in converting visitors into paying customers. It reflects the combined impact of marketing, product relevance, user experience, pricing, and trust. A higher conversion rate indicates a successful end-to-end customer journey, while a lower rate highlights inefficiencies in engagement or purchase flow. Organizations use this metric to evaluate business success, optimize marketing campaigns, and improve user experience strategies.

CUSTOMER SEGMENTATION MODEL

Customer segmentation is used to group users based on their behavior, engagement level, and purchase patterns, enabling more targeted strategies.

New Users are individuals who have recently joined the platform and are in the exploration phase. They typically interact with basic features such as browsing and product viewing. The main goal for this segment is to improve onboarding experience by making navigation easier, introducing personalized recommendations early, and encouraging first-time engagement.

Active Users are those who frequently interact with the platform by browsing products, engaging with features, and occasionally making purchases. This group represents the core user base. The main objective for this segment is to increase conversions by offering personalized recommendations, targeted offers, and better engagement strategies.

Frequent Shoppers are high-value users who make repeated purchases and show strong loyalty toward the platform. These users contribute significantly to revenue and long-term growth. The primary goal for this segment is to build loyalty programs, exclusive rewards, and premium benefits to maintain long-term engagement.

Inactive Users are those who have shown reduced or no recent engagement with the platform. They are at risk of churn and loss. The goal for this segment is to reduce churn through re-engagement strategies such as notifications, discounts, personalized offers, and win-back campaigns.

Virtual Try-On Users are users who actively engage with the virtual try-on feature. These users are highly interactive and show stronger purchase intent due to better product visualization. The goal for this segment is to improve conversion from try-on by enhancing accuracy, personalization, and integration with recommendation systems.

CONVERSION FUNNEL MODEL

The conversion funnel represents the step-by-step journey of a customer from discovering the platform to completing a purchase.

The journey begins with App Open, where users access the platform for the first time or return to browse. This stage measures overall reach and initial engagement.

Next is Homepage View, where users explore categories, trending items, and featured collections. This stage is important for capturing attention and guiding users deeper into the platform.

The Product View stage represents users actively exploring specific items. This is a critical decision-making stage where users evaluate product details, images, pricing, and reviews.

The Virtual Try-On stage allows users to visualize products before purchase. This stage significantly improves confidence and reduces uncertainty, especially in fashion e-commerce.

Add to Cart is the next stage where users save products they intend to purchase. This indicates strong interest and purchase intent.

Checkout represents the stage where users proceed to payment processing. It reflects high purchase readiness and trust in the platform.

Finally, Purchase is the completion stage where the transaction is successfully completed. This is the most important metric for revenue generation and business success.

Each stage in this funnel helps identify drop-off points, allowing businesses to optimize user experience, reduce abandonment, and improve overall conversion rates.

DASHBOARD ARCHITECTURE

1. User Growth Dashboard

- Total users
- New users
- Growth trends

2. Engagement Dashboard

- DAU / MAU
- Session duration
- Product views

3. Retention Dashboard

- Retention curves
- Cohort analysis

4. Conversion Dashboard

- Funnel visualization
- Drop-off rates

5. Virtual Try-On Dashboard

- Try-on usage
- Conversion impact
- Product interaction analysis

COMPETITOR ANALYSIS

Studied Platforms:

- Myntra
- AJIO

- Nykaa Fashion
- Amazon Fashion

Key Focus Areas:

- Personalization systems
- Recommendation engines
- Marketing strategies
- User experience
- Retention mechanisms

Findings:
Personalization and recommendation systems strongly influence customer engagement and retention.

AI RECOMMENDATION SYSTEM (RESEARCH)

The AI Recommendation System is a conceptual and research-based component of the analytics framework designed to enhance personalization and improve user experience in a fashion e-commerce environment. It focuses on analyzing user behavior patterns and leveraging them to generate intelligent, relevant, and timely product suggestions.

The system is built on the idea that every user interaction provides meaningful signals about preferences, interests, and purchase intent. By processing these signals, the recommendation engine can deliver highly personalized shopping experiences that improve engagement and conversion outcomes.

INPUTS

The recommendation system uses multiple data sources to understand user preferences and behavior:

• **User Behavior**
Includes browsing activity, product views, clicks, session duration, and navigation patterns. This helps in understanding user interests and interaction habits.

• **Purchase History**
Analyzes previously purchased products to identify preferences in style, category, brand, and price range. This helps in predicting future buying behavior.

• **Wishlist Data**
Represents user interest in specific products that may not have been purchased yet. This is a strong indicator of intent and preference.

• **Try-On Interactions**
Includes virtual try-on usage data such as products tried, frequency of try-ons, and engagement with different styles. This helps in understanding visual preference and fit confidence.

OUTPUTS

Based on the processed inputs, the system generates intelligent recommendations such as:

• **Personalized Products**
Tailored product suggestions based on individual user preferences and behavioral history.

• **Similar Items**
Recommendations of products that are visually or functionally similar to items the user has interacted with.

• **Trending Recommendations**
Popular or high-performing products that are currently trending among similar user segments.

• **Outfit Suggestions**
Complete outfit combinations generated by analyzing compatibility between different fashion items such as tops, bottoms, footwear, and accessories.

BENEFITS

The AI recommendation system provides several key advantages for both users and the platform:

• **Higher Engagement**
Users are more likely to interact with relevant and personalized product suggestions, leading to increased platform activity.

• **Better Conversions**
Personalized recommendations increase the likelihood of purchase by showing users products that match their preferences and intent.

• **Improved User Satisfaction**
A more relevant and curated shopping experience enhances customer satisfaction and builds long-term loyalty.

Overall, the AI recommendation system plays a crucial role in transforming a traditional e-commerce platform into an intelligent, personalized, and user-centric fashion ecosystem. It bridges the gap between user intent and product discovery, enabling more effective decision-making and improved business performance

SECURITY AND DATA PRIVACY

Security and data privacy are critical components of any modern analytics system, especially in a fashion e-commerce platform where large volumes of sensitive user data are collected, processed, and analyzed. Ensuring the protection of user information is essential to maintain trust, comply with regulations, and safeguard the integrity of the platform.

The analytics framework designed in this project takes into account multiple layers of security and privacy considerations to ensure responsible handling of data throughout the entire pipeline—from data collection to reporting and visualization.

The key considerations include:

• **User Data Protection**
User data such as browsing history, purchase behavior, preferences, and interaction logs must be protected from unauthorized access or misuse. Proper safeguards ensure that sensitive user information remains confidential and is used only for intended analytical purposes.

• **Secure Data Storage**
All collected data should be stored in secure environments with appropriate encryption and database security measures. This helps prevent data breaches, unauthorized modifications, and potential data loss.

• **Access Control Mechanisms**
Role-based access control (RBAC) should be implemented to ensure that only authorized personnel can access specific datasets and reports. This minimizes the risk of internal data misuse and ensures proper data governance within the system.

• **Data Anonymization**
Personal identifiers should be removed or masked before analysis to protect user identity. Anonymization ensures that insights can be derived from data without exposing individual user information, thereby maintaining privacy standards.

• **Privacy Compliance Awareness**
The system should follow general data privacy principles and industry best practices, ensuring awareness of regulations related to data protection. This includes responsible data usage, transparency in data handling, and adherence to ethical analytics practices.

Overall, these security and privacy measures ensure that the analytics system operates in a safe, ethical, and compliant manner while still enabling meaningful business insights. They play a crucial role in maintaining user trust and ensuring long-term sustainability of the platform.

BUSINESS INTELLIGENCE REPORTING

The analytics system generates a wide range of structured reports that consolidate data insights into meaningful and actionable business intelligence. These reports are designed to provide a clear understanding of platform performance across different dimensions such as user behavior, engagement patterns, retention trends, conversion efficiency, and market positioning.

The reports generated during the internship include:

• KPI Performance Reports – These reports summarize key performance indicators such as user growth, engagement rates, retention metrics, and conversion ratios. They provide an overall view of platform health and performance trends over time.

• Engagement Analysis Reports – These reports focus on how users interact with the platform, including session duration, product views, feature usage, and activity frequency. They help identify which features drive the most user engagement.

• Retention Reports – These reports analyze user return behavior and churn patterns. They highlight how effectively the platform retains users over time and identify factors influencing long-term customer loyalty.

• Conversion Reports – These reports examine the complete user journey from product discovery to final purchase. They help identify drop-off points in the conversion funnel and suggest areas for optimization to improve sales performance.

• Competitor Analysis Reports – These reports compare Raritone with leading fashion e-commerce platforms in terms of features, user experience, personalization, and engagement strategies. They help identify industry best practices and competitive gaps.

• Marketing Performance Reports – These reports evaluate the effectiveness of marketing campaigns by analyzing metrics such as user acquisition, conversion rates, customer acquisition cost, and overall return on investment.

The primary purpose of generating these reports is to support **data-driven decision-making** within the organization. By converting raw data into structured insights, these reports enable stakeholders to make informed strategic decisions, improve user experience, optimize business processes, and enhance overall platform performance.

PROJECT OUTCOMES

The Raritone Data Analyst Internship project successfully achieved multiple analytical, research-based, and business intelligence objectives. The outcomes demonstrate how structured data analysis and customer behavior understanding can be used to generate meaningful insights for improving a fashion e-commerce platform.

One of the key achievements was the **identification of important business KPIs (Key Performance Indicators)** that are essential for tracking platform performance. These KPIs helped in measuring user engagement, retention, conversion efficiency, and overall customer activity across the platform. This provided a strong foundation for performance evaluation and decision-making.

The project also resulted in the **development of a structured analytics framework**, which defines how user data flows from collection to insight generation. This framework ensures a systematic approach to analyzing customer behavior and converting raw data into actionable business intelligence.

Another major outcome was **customer segmentation modeling**, where users were categorized into meaningful groups such as new users, active users, frequent shoppers, inactive users, and virtual try-on users. This segmentation helps in understanding different user behaviors and supports targeted marketing and personalization strategies.

The project also included **conversion funnel analysis**, which mapped the complete user journey from app entry to final purchase. This analysis helped identify drop-off points in the customer journey and highlighted areas where user experience improvements can significantly increase conversion rates.

A significant outcome was the generation of **virtual try-on behavioral insights**, which provided an understanding of how users interact with virtual try-on features and how these interactions influence purchase decisions. It highlighted the importance of immersive experiences in increasing customer confidence and reducing product returns.

The project further contributed to **business intelligence reporting**, where all analytical findings were organized into structured reports and dashboards. These reports enable stakeholders to easily understand performance trends, customer behavior, and business opportunities, supporting data-driven decision-making.

Finally, the project included **competitor benchmarking analysis**, where major fashion e-commerce platforms were studied to understand industry standards and best practices. This helped identify strengths, weaknesses, and opportunities for improvement in personalization, engagement, and user experience strategies.

Overall, these outcomes collectively demonstrate the successful application of data analytics in understanding customer behavior, improving platform performance, and supporting strategic business growth for a fashion e-commerce ecosystem.

FINAL CONCLUSION

The Raritone Data Analyst Internship provided comprehensive exposure to real-world analytics systems used in modern fashion e-commerce platforms. It offered practical insight into how large-scale digital platforms rely on data-driven decision-making to understand user behavior, optimize performance, and enhance customer experience.

Throughout the internship, extensive analysis was conducted on customer behavior patterns, engagement metrics, retention trends, conversion funnels, and virtual try-on interactions. This experience demonstrated how raw user activity data can be systematically transformed into structured insights that support strategic business decisions.

The project clearly highlights how data analytics plays a crucial role in improving key business areas such as:

• User engagement by identifying features and experiences that attract and retain users
• Customer retention by analyzing user loyalty, churn behavior, and return patterns
• Conversion rates by optimizing the customer journey and reducing drop-offs in the funnel
• Product discovery by enhancing recommendation systems and search experiences
• Overall business growth by supporting data-driven strategies and performance optimization

In addition, the internship helped in developing a strong understanding of KPI frameworks, dashboard design, customer segmentation models, and competitor benchmarking techniques. Working with these analytical concepts improved the ability to interpret data, identify trends, and convert findings into meaningful business recommendations.

Overall, the internship significantly strengthened core analytical capabilities, including critical thinking, business understanding, reporting skills, visualization techniques, and data interpretation. It also provided practical exposure to how analytics is applied in real-world business environments, particularly in the fashion e-commerce industry.

This experience has laid a strong foundation for future growth in the field of data analytics and business intelligence, and has enhanced readiness for working on complex, data-driven projects in professional environments.
