

Raritone Data Analytics Team – Prediction Analytics & Customer Intelligence Report

Executive Summary

This report uses sample (fictional) data to demonstrate how Raritone can use customer intelligence, purchase prediction, retention analytics, and AI-driven insights to improve engagement and conversions.

Customer Intelligence Profiles

1. Trend Seeker (18-24): High social media activity, frequent browsing.
2. Smart Shopper (25-34): Price-sensitive, responds to offers.
3. Premium Buyer (25-40): High order value, strong brand loyalty.

Sample KPI Dashboard Data

Monthly Active Users: 52,400
Virtual Try-On Users: 18,900
Conversion Rate: 7.8%
Retention Rate: 64%
Average Order Value: ₹2,450

Demand Trend Analysis

Sample demand data indicates a 133% increase in orders over two months, driven by virtual try-on engagement and personalized recommendations.

AI Purchase Prediction Analysis

The AI model classifies users into purchase probability groups using browsing behavior, wishlist activity, try-on frequency, session duration, and cart additions.

Visual Example of AI Analysis System

User Activity → Feature Extraction → AI Prediction Engine → Purchase Probability Score → Personalized Recommendation

Example:

- Product Views: 18
- Try-On Sessions: 7
- Wishlist Saves: 5
- Cart Additions: 3
- Predicted Purchase Probability: 87%
- Recommended Action: Send premium fashion recommendations.

Try-On Engagement Insights

Top Categories: Sneakers, Casual Wear, Dresses, Accessories.

Users with 3+ try-on sessions convert 2.4x more frequently than average users.

Retention Recommendations

1. Personalized push notifications
2. Loyalty rewards program
3. AI-based recommendations
4. Cart recovery campaigns
5. Exclusive member-only collections

Conclusion

The sample analysis demonstrates how predictive analytics can identify high-value customers, forecast demand, and improve retention through intelligent recommendations.
